

Specification Page 24 - Amended without Underlining
And Strikethroughs - Clean Version

bundling portion 40 to first form the filament bundling body 31. Thereafter, at substantially the central portion with respect to the fiber direction, the filament bundling body 31 and the base material sheet 6 are bonded to each other by means of the adhesive 50 at a band-like bonding portion 51 with a width including the bundling portion 40. The movable portions of the filaments 30 form the main cleaning portion 20. By fluffing the main cleaning portion 20 outside the plane of the base material sheet 6, it is possible to obtain the mop-head-like cleaning device of this embodiment. Since the distal ends 21 can move around in a wide range, the cleaning device of this embodiment is capable of not only capturing dust on a flat surface or a convex surface but also scraping out dust in a groove and catching the same.

In the second and third embodiments described above, it is also desirable to place a brush sheet with a plurality of bristle-like members between the filament bundling body 31 and the base material sheet 6 and to integrally bond them to each other by means of an adhesive.

Here, description will be made on the advantage of a certain variation, between filaments 30 close to each

other, in the lengths and positions of the movable portions of the filaments 30, that is, the lengths from the fixed ends 22 to the distal ends 21 of the filaments 30 and the positional relationship thereof. When the lengths of the movable portions and the positions of the
